

# Understanding the Alignment of LHCb's Scintillating Fibre Tracker

**Nils Breer**, Sophie Hollitt, Johannes Albrecht **16.03.2023** 

DPG spring Conference, Dresden

#### **Overview**

- The SciFi Detector Upgrade
- Importance of the SciFi and Alignment
- Understanding first alignments on 2022 data

N.Breer | 16.03.2023 2/15

#### Importance of alignments

- Alignment is part of the LHCb trigger system
- Physics performance tied to alignment performance
- with optimal alignment:
  - > remove systematic biases for asymmetry measurements
  - best possible mass resolution

N.Breer | 16.03.2023 3 / 15

#### LHCb upgraded with the SciFi

- Consists of 3 stations: T1, T2, T3
- 4 layers per station: X1, U, V, X2
- replaces former IT and OT to cope with the increased instantaneous luminosity

N.Breer | 16.03.2023 4/15

# The Scintillating Fibre Tracker

- Front two stations have 5 modules per side
- Back station has 6 modules on each side
- U, V layers have a **75 deg** stereo angle respectively
- → used for determining y-position of track by comparing hitposition at different angles

N Breer | 16.03.2023 5 / 15

Q3

Q1

A-side

### SciFi terminology

layers are divided into two halves commonly labeled as A-side and C-side

quarter								longmodule					
	M4	M3	M2	M1	МО		МО	M1	M2	M3	M4		Q2
	M4	M3	M2	M1	МО		МО	M1	M2	M3	M4		Q0
	half-							half-					C-side
module							layer	-					

N.Breer | 16.03.2023 6 / 15

#### What is Alignment and why do we need it?

- top: ideal detector, bottom: physical detector
- Surveys are used to find the rotation and position of each detector component
- Are used as starting positions for software alignment
- Building tracks accurately requires positions in reconstruction to be as similar as possible to real positions

N.Breer | 16.03.2023 7/15

#### The survey: what is it and the different types

• measure distance of some points on the detector with a laser

- 2022: photogrammetry was recorded in assembly hall → not quite perfect
- 2023: photogrammetry will be recorded in cavern

für Bildung und Forschung

- relative angles and positions between points are compared to simulation
- layer survey: performed in the cavern on the layer in the front in closed state (both halves together)
- module survey: performed inside assembly hall using reflective stickers keeping track of all positions

N.Breer | 16.03.2023 8 / 15

#### Alignment: track fits with the Kalman Filter

Alignment Update alignment constants

- Use survey information as starting point
- aligning the detector by minimizing the residuals of the track hits
- basically a  $\chi^2$  minimization problem with alignment parameters  $\alpha$
- Why Kalman Filter?
  - easily models material interactions as well as multiple scattering
- propagation of nodes, minimization, smooth error sizes by back propagation

N Breer | 16 03 2023 9 / 15

# Alignment versions in use

- V1: First ever SciFi alignments for the upgraded LHCb detector, which is using early tracks from comissioning
- use full length modules
- alignable degrees of freedom: Tx Rz (x translation, rotation around  $z \rightarrow beam pipe$ axis)

- V2: Updated alignment version with what we learned from V1
- aligned using half modules
- uses newest time alignment

N Breer | 16.03.2023 10 / 15

### Hit distribution per quarter in V1 and V2 alignment

- Improvements to V2 visible on A-side, losing some performance on C-side
- Alignment performance difference in each quarter → seperately analyse quarters!
- $\bullet$   $\chi 2$  per quarter can provide more insights about alignment performance in each detector part
  - analysis of each quarter seperately makes finding possible issues easier

N.Breer | 16.03.2023 11 / 15

# Looking for causes of the v2 quarter problem

• mean residual per quarter weighted:

$$\overline{\text{Res}_L} = \sum_{\text{layer,quarter}} \frac{\text{hits quarter of layer}}{\text{hits layer}}$$

- goal: residual around 0 per layer
- V2 alignment shows overall improvement in alignment quality in every layer of the SciFi
- Investigating why T2X2 has a larger mean residual than any other layer

N Breer | 16.03.2023 12 / 15

#### Track hits comparison of V2 and simulation

- MC: hits on **reconstructed** tracks fill whole detector
- data: filling tracks into A-side → good!
- → scan C-side quarters for possible issues in distinct layers

N.Breer | 16.03.2023

#### New Q0 positions in T2X2 layer

- Changes based on V2 alignment positions
- test incremental shifts of position/rotation until we found an improvement
- rotations are with regard to the local frame of the module
- positions: translations relative to the nominal position for each module
- V2 alignment has only few tracks in Q0 because parts of the SciFi are too far out of alignment

N.Breer | 16.03.2023 14 / 15

#### **Summary**

- Trying to solve a puzzle on unexpected lower number of alignment tracks on the C-side
- Source of complications: SciFi parts too far out of alignment to be corectly updated
- ullet Varying the positions and rotations of Q0 modules yielded more tracks in more modules
- Feeding this back into tracking alignment to get the fine tuning right
- new survey/photogrammetry in progress to improve alignment starting conditions this year

Thank you for your attention!
